Source: Evidence Report of Clinical Guidelines on the Identification, Evaluation, and Treatment of Overweight and Obesity in Adults, 1998. NIH/National Heart, Lung, and Blood Institute (NHLBI)

Healthy weight ranges would be any weight that is a BMI of less than 25 for that height. Overweight ranges would be any weight that is a BMI of 25 - 29 for that height. Obese would be any weight that is a BMI of 30 or above for that height. Underweight ranges would be any weight less than the ones on the chart. That means we can draw a straight line down all rows between the 24 and 25 BMI and know that all the weights to the left of that line are in the "Healthy weight range". We can draw another straight line down all the rows between the 29 and 30 BMI and know that all the weights between the first line and this line are in the "Overweight range". All the weights to the right of this line are in the "Obese weight range". All weights less than those on this chart are in the "Underweight range".

Maintaining a healthy weight can increase life expectancy, quality of life, and physical and mental well being. As an individual you can help maintain a healthy weight by eating the recommended number of calories each day and getting regular exercise. Make sure you consult your physician before making any changes to your diet or beginning a new exercise program. ¹
